Lead Scoring Case study

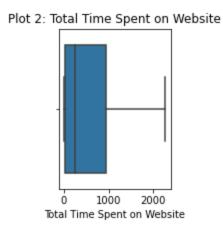

Problem Statement

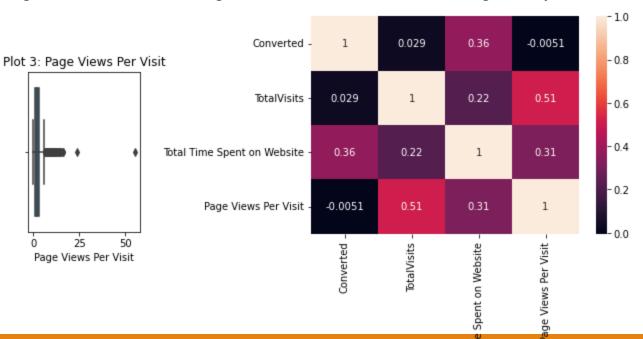

To build a Lead Scoring(logistic regression) model to assign a lead score to each of the leads which can be used by X Education to target potential leads which would help the company to get more customers.

Pre-Process Approach

- First, columns with more than 30% of missing value percentage is removed.
- Categorical variables 'Do Not Call', 'Newspaper Article', 'X Education Forums', 'Search', 'Newspaper', 'Digital Advertisement' and 'Through Recommendations' had constants with more than 99% of data points having same category and hence dropped.
- •For remaining categorical variables, the missing values were imputed with Mode and numerical with Median.
- Numerical Variables 'TotalVisits' and 'Page Views Per Visit' had outlier values and has less correlation with the target and these were dropped.
- •The remaining numerical variables were normalized using standard scalar and categorical variables were encoded using dummy variables.

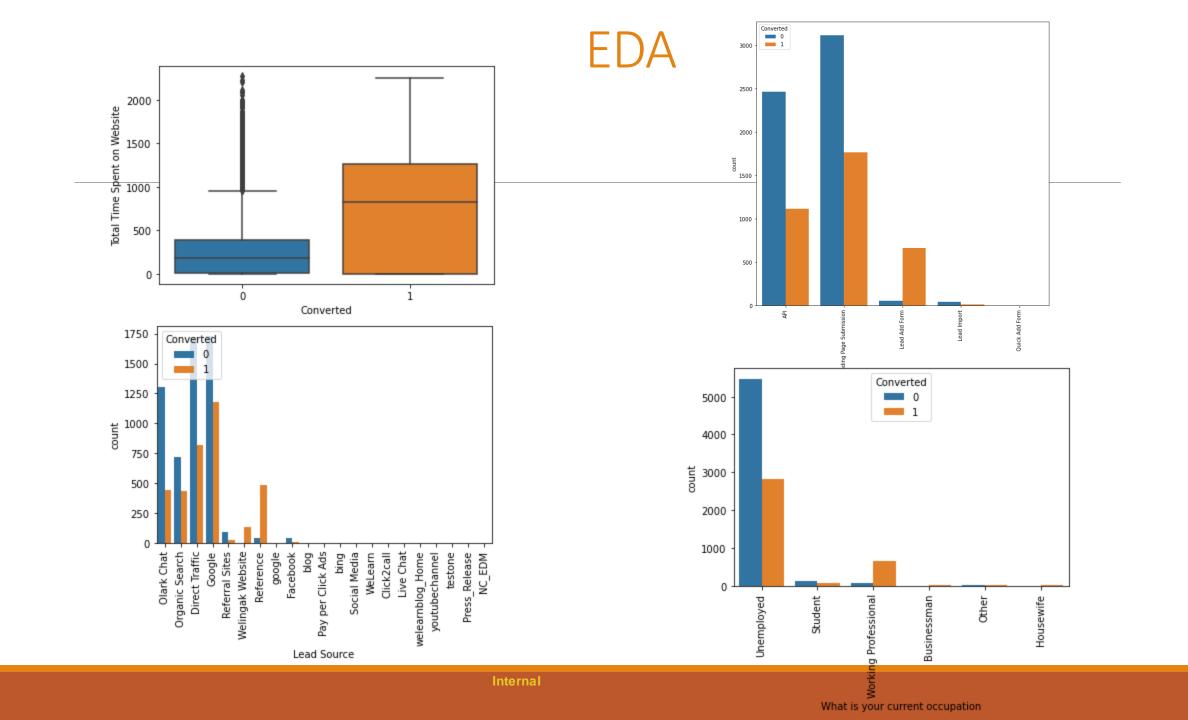

EDA

- •API and Landing Page submission brings most of the leads whereas the conversion rate is higher for Lead Add Form.
- Lead Import and Quick Add Form brings very few leads and Quick Add Form is having a zero conversion rate.
- •In lead source, Direct Traffic and Olark Chat brings in huge number of leads but suffers very low conversion whereas Google has good lead inputs and decent conversion.
- In lead source, reference shows the highest conversion rate
- In Last Activity, Had a Phone Conversation and SMS sent seems to generate hot leads having good conversion rate.
- •Unemployed people seems to be making up for most of the leads but with low conversion of about half.
- Businessman and Working Professional contribute for higher conversions.
- •Housewives are having less lead generation percentage, but the generated leads tend to be converted.
- •Leads spending more time in website are likely to be converted.

Model Performance

The final model was fit after taking in only relevant features based on p-value and VIF.

Conclusion

Working professionals tends to be converted most whereas unemployed leads are less likely to be converted despite of greater lead numbers.

Leads spending more time on the website gets converted more and should be given high focus.

Lead Add Form seems to be the best Lead Source.
